Key insights

- Key Insights:
- Hypertension prevalence is ~52% in the dataset
  - Risk increases significantly with age
  - Family history is a major risk factor (~66% vs ~38%)
  - Smoking is associated with higher hypertension rates
  - BMI shows weak standalone influence
  - Exercise shows no clear protective effect; observed patterns likely reflect confounding factors

Slicer ( Age Group - Smoking Status - Exercise Level )

Age\_Group, Smoking\_Status, Exercise\_Level

- ▽ ☐ 30-49
- ▽ ☐ 50-69
- ▽ ☐ 70+
- ▽ ☐ Under 30
